Maximizing Profits for Solar Manufacturers

AURORA SOLAR TECHNOLOGIES

has developed a **disruptive** new solar cell profiling technology that allows solar cell producers to increase cell power and yield.

Attaining profitability in a sector with very slim margins is the solar industry's most urgent imperative. Despite this, cell fab lines are running without the most basic inline measurement and control resulting in very poor product uniformity and high scrap rates.

Aurora's non-invasive sensor technology brings cell producers rapid payback by producing more uniform, higher efficiency cells.

THE OPPORTUNITY - The solar industry is expected to triple by 2020.

Global revenue from Photovoltaic (PV) systems to exceed \$1.2 trillion by 2024.

The motivation to **reduce costs** and **increase efficiency** is high, as the solar sector downgrades 15-25% of their production.

Aurora's products **improve cell efficiency and eliminate downgrades.**

THE PRODUCTS

Decima 3T™

Inline, non-contacting infrared wafer profiling system essential to produce high efficiency cells.

Decima Gemini™

Dual Decima measurement heads to measure simultaneously both sides of a solar cells – suitable for PERC or bifacial solar cells

Aurora Veritas™ Software visualization and statistical process control.

AURORA VISION

Create the Standard for Quality Control Systems (QCS) for the global PV Industry

Aurora senior management has extensive knowledge in process control and optimization and a successful track record building the leading global QCS technology company in the paper/plastics/metals industry that sold for US\$600 million.

Disrupt the industry with the only **inline MEASURE, VISUALIZE and CONTROL** solution.
